

Practical Knowledge for Adaptation Briefing Session

➤ **Bunbury**

The effect of climate is something that all Australians struggle with at sometime – whether its extreme heat, flooding, bushfires or failing crops. It impacts our regions and the communities and organisations – how they function, how they do business and how they adapt to change. When we look ahead to the future, the challenges become harder and the risks higher.

So how will we adapt to a changing climate?

The National Climate Change Adaptation Research Facility (NCCARF) has developed resources to help practitioners understand the science and the impact climate change and in particular, the ways to reduce some of the risks.

In this short briefing session we will introduce participants to a number of practical resources developed from the latest research in Australia. Topics include:

-  Extreme climate events (heatwaves, floods, wind storms, bushfires)
-  Building community resilience
-  Adaptive management for natural ecosystems
-  Finance, planning and engineering.

The session includes lunch followed by a short presentation and guided discussion.

Join us from 12pm-3pm on the 31st of May, Main Conference Room, SWCC / DAFWA Regional Office, 1 Verschuer Place Davenport, Bunbury.
Please RSVP to nccarf@griffith.edu.au or marilee.campbell@griffith.edu.au.
